

Trivi — a tiny app for quick questions

\$1

This tiny app does three things, and you can add more yourself:

1. Translate a word into your languages — all at once.
 2. Explain a concept, a phrase, or a topic in 3–6 short sentences.
 3. Answer a quick question with just the answer (no fluff).
-

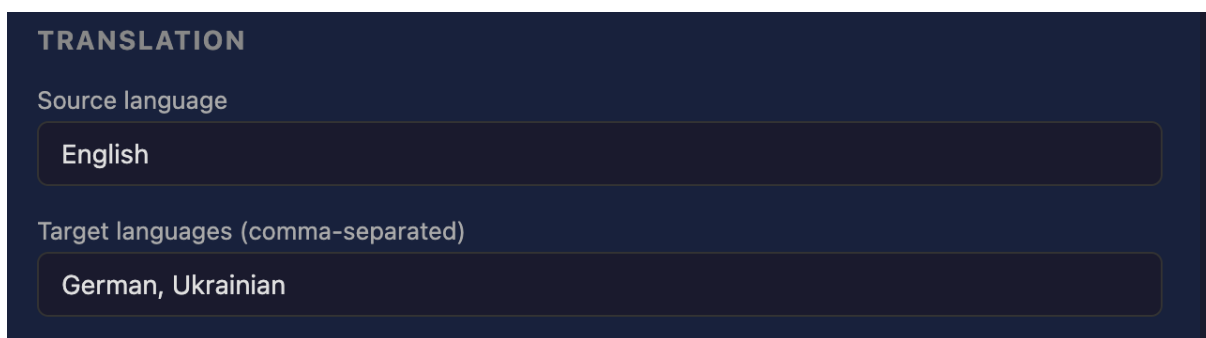

How it looks

You type one word — for example, `dispatch` — and you immediately see translations into every language you've chosen, with example sentences:

Translation works for any language. In Settings you choose:

- Source language — the language you type in (e.g. English)
- Target languages — the languages you want answers in (e.g. German, Ukrainian — or French, Spanish, Polish, Japanese... any combination, as many as you want)

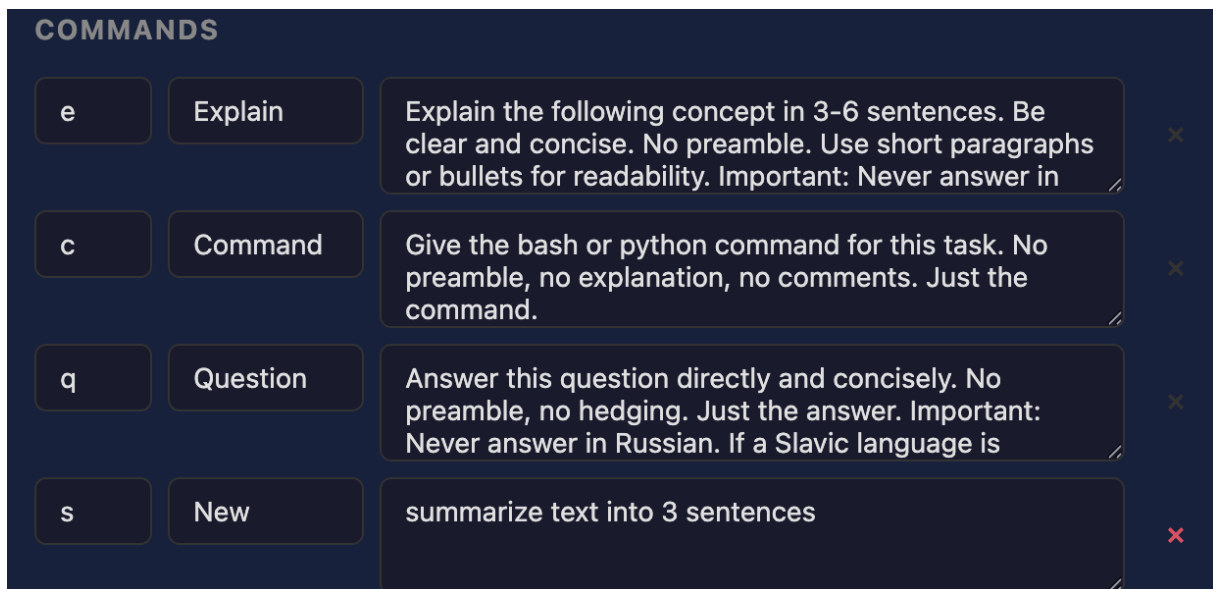

Commands — short letters that tell the app what to do

Translation is the default — just type a word. For anything else, you start with a one-letter command and a space:

- **e** — Explain. Type **e black holes** → you get a 3–6 sentence explanation.

- **q** — Question. Type `q capital of Lithuania` → you get `Vilnius`. Just the answer.
- **c** — Command. (For coders) Type `c rename all .txt files to .md` → you get the exact terminal command.

You can also add your own. For example, the letter **s** for "summarise this text in 3 sentences", or **f** for "fix my grammar", or **p** for "make this more polite". Whatever you do often. You write the instruction once in Settings, and from then on a single letter does it.

Think of commands like shortcuts on your keyboard — except instead of `Ctrl+C` to copy, it's **e** to explain, **q** to ask, **s** to summarise. One letter, one job.

What it's for

You're reading, writing, or working, and a small question pops up. A word you don't know. Something you want translated. A concept you want explained quickly.

Normally you stop, open Google or ChatGPT, get distracted, lose your flow.

Trivi opens with one tap. You type, press Enter, get the answer, close it. Back to work.

What you get for \$1

1. A link to the app. Open it in any browser. Bookmark it, or "install" it like a normal app on your phone or laptop (one click — instructions inside).
2. A short PDF guide (5 minutes, with screenshots) that walks you through:
3. getting a free Google key (this powers the answers — free for normal use, no credit card)
4. choosing your languages
5. adding your own commands

6. The full source code on GitHub — so you (or any techie friend) can verify the app is honest and doesn't collect your data.
-

Common questions

- Account? No.
- Subscription? No. One-time \$1.
- Where do my questions go? Straight from your browser to Google. Nothing passes through me.
- Do I need to be technical? No. If you can copy-paste a key once, you're set.
- Phone or computer? Both. Anything with a browser.
