

Trivi — Your Side-Brain for Trivial Tasks

The Problem

You're deep in a conversation with ChatGPT, debugging code, or reading an article. You hit an unfamiliar word. A term you half-know. A bash command you can't quite remember.

What do you do?

- Open a new browser tab → go to Google Translate → type the word → get the answer → switch back. Friction. Context switching.
- Ask your AI chat → it answers in 3 paragraphs → now you have to scroll past it to find where you were. Thread polluted.
- Or — and this is what most of us actually do — **you skip it**. You move on. You tell yourself you'll look it up later. You won't.

Every skipped word is a small hole in your understanding. One is fine. Ten in an article? You're reading the surface.

I built Trivi because I was tired of skipping.

What Trivi Is

Trivi is a tiny app that lives on your phone or desktop — always one tap away. You type a word, a question, or a command prefix, hit Enter, and get an instant answer. Then you go back to what you were doing.

No chat threads. No scrolling. No context switching. No accounts.

It does four things:

Translate

Just type any word or phrase. Trivi translates it to **all your languages at once.**

This was my original motivation. I'm bilingual — Ukrainian and German — and when I hit a tricky English expression, I need it in both languages to really get it. I used to type "translate to de and ukr" into my AI chat every single time. Now it's automated: type the word, hit Enter, get both translations instantly. You configure your target languages once in Settings, and every lookup just works.

No prefix needed — translation is the default mode. Type "deploy", get German and Ukrainian side by side in half a second.

Explain

Type **e** + your question. Get a clear 3-6 sentence explanation. Not a lecture — just enough to understand and move on.

e what is a reverse proxy

e what is a reverse proxy

Explain • Gemini (gemini-2.0-flash-lite)

A reverse proxy is a server that sits in front of one or more web servers, intercepting requests from clients.

Instead of clients communicating directly with backend servers, the reverse proxy receives the request first and forwards it to the appropriate server.

This provides benefits like load balancing, SSL termination, caching, and hiding the identity of backend servers.

Common examples include **Nginx** and **Cloudflare**.

made by litai

Command

Type **c** + what you need. Get the bash or Python command. Nothing else. Copy it and go.

```
c find all files larger than 100mb
```

c find all files larger than 100mb

Command • Gemini (gemini-2.0-flash-lite)

```
find / -type f -size +100M -exec
```

Copy

made by litai

Question

Type **q** + anything. Get a direct answer. No preamble, no hedging.

q capital of Uzbekistan

Why It Works

The magic isn't the AI. The AI is the same Gemini or ChatGPT you already use.

The magic is **friction removal**.

Opening a translator takes 5-8 seconds of context switching. That's enough for your brain to decide "not worth it." Trivi takes under 1 second — tap the app, type, Enter, done. That tiny difference changes behavior: you actually look things up instead of skipping them.

I noticed it in myself after a week: I was translating words I would have skipped before. My reading comprehension in English texts genuinely improved because I stopped ignoring gaps.

You Can Expand It

The four built-in modes are just the start. Open Settings and add your own command prefixes with custom prompts.

Some ideas: - **s** → Summarize: "Summarize this in 2 sentences" - **g** → Grammar: "Fix the grammar in this sentence, output only the corrected version" - **d** → Define: "Give the dictionary definition, etymology, and one example sentence" - **r** → Rewrite: "Rewrite this more concisely"

Gemini API Key

.....

Key saved

OpenAI API Key (optional fallback)

sk-...

Optional — used as fallback if Gemini fails

TRANSLATION

Source language

English

Target languages (comma-separated)

German, Ukrainian

COMMANDS

e

Explain

Explain...

✕

c

Answer directly...

✕

s

Summar

Summarize this in 2 sentences

✕

+ Add command

Save

made by litai

Your commands, your prompts, your shortcuts.

Setup (5 Minutes, Once)

1. Get a Free Gemini API Key

1. Go to aistudio.google.com
2. Sign in with any Google account
3. Click **"Get API Key"** in the left sidebar
4. Click **"Create API Key"**
5. Copy the key (starts with AIza...)

The free tier gives you ~15 requests per minute. More than enough.

2. Open Trivi

Go to: [YOUR TRIVI URL]

3. Enter Your Key

1. Tap the gear icon (Settings)
2. Paste your Gemini API Key
3. (Optional) Add an OpenAI key as fallback
4. Set your translation languages
5. Tap **Save**

Type here...

c	Commar	Give the command...	×
q	Questior	Answer directly...	×
s	Summar	Summarize this in 2 sentences	×

+ Add command

4. Install as App (Recommended)

On iPhone: Safari → Share → "Add to Home Screen" **On Android:** Chrome → Menu → "Add to Home Screen" **On Mac/PC:** Chrome → address bar install icon

Now Trivi is one tap away. Always.

How It Works (Under the Hood)

- **No accounts.** No sign-up. No data collection.
 - **Your keys, your data.** API keys are stored in your browser only. They go directly to Google/OpenAI — never through our servers. There is no server.
 - **Works offline** (app shell loads from cache; API calls need internet).
 - **Cyrillic keyboard support.** Ukrainian `е` works as `е`, `с` as `с` — no keyboard switching needed.
 - **20KB total.** The whole app is smaller than a single photo.
 - **Open source.** [Source code on GitHub](#) — nothing hidden.
-

Quick Reference

Type this

`hello`

`е DNS`

`с list docker containers`

`q who painted starry night`

Get this

Translation of "hello"

Explanation of DNS

The bash command

Direct answer
